

GPCE 2016

October 31 – November 1, 2016 ● Amsterdam, Netherlands collocated with SPLASH/OOSPLA and SLE

15th International Conference on Generative Programming: Concepts & Experiences

GPCE is a venue for researchers and practitioners interested in techniques that use program generation, domain-specific languages, and component deployment to increase programmer productivity, improve software quality, and shorten the time-to-market of software products. In addition to exploring cutting-edge techniques of generative software, our goal is to foster further cross-fertilization between the software engineering and the programming languages research communities.

General Chair

Bernd Fischer (Stellenbosch University)
Program Chair
Ina Schaefer (TU Braunschweig)
Publicity Chair
Christoph Seidl (TU Braunschweig)

Program Committee

Kenichi Asai (Ochanomizu University) Anya Helene Bagge (University of Bergen) Walter Binder (University of Lugano) Sandrine Blazy (IRISA - Rennes) Ras Bodik (University Washington) Shigeru Chiba (University of Tokyo) Ewen Denney (NASA Ames) Sebastian Erdweg (TU Darmstadt) Martin Erwig (Oregon State University) Matthew Flatt (University of Utah) Aniruddha Gokhale (Vanderbilt Univ.) Jeff Gray (University of Alabama) Michael Haupt (Oracle Labs) Christian Kästner (CMU) Julia Lawall (INRIA) Derek Rayside (University of Waterloo) Tiark Rompf (Purdue University) Ulrik Schultz (U. of Southern Denmark) Sandro Schulze (TU Hamburg-Harburg) Mary Sheeran (Chalmers U) Norbert Siegmund (University of Passau) Walid Taha (Halmstad University) Tijs Van Der Storm (CWI) Steffen Zschaler (King's College London)

Submissions

Research papers 10 pages (sigplan style) Tool demos and short papers 4 pages

Abstract Submission: June 17, 2016 Full Paper Submission: June 24, 2016 Author Notification: August 26, 2016

Call for Papers

Generative and component approaches and domain-specific abstractions are revolutionizing software development just as automation and componentization revolutionized manufacturing. Raising the level of abstraction in software specification has been a fundamental goal of the computing community for several decades. Key technologies for automating program development and lifting the abstraction level closer to the problem domain are **Generative Programming** for program synthesis, **Domain-Specific Languages** (DSLs) for compact problem-oriented programming notations, and corresponding **Implementation Technologies** aiming at modularity, correctness, reuse, and evolution. As the field matures **Applications** and **Empirical Results** are of increasing importance.

GPCE seeks contributions on all topics related to generative software and its properties. Topics of interest include, but are not limited to:

Generative software

- Domain-specific languages (language extension, language embedding, language design, language theory, language workbenches, interpreters, compilers)
- Product lines (domain engineering, feature-oriented and aspect-oriented programming, preprocessors, feature interactions)
- Metaprogramming (reflection, staging, partial evaluation)
- Program synthesis
- Implementation techniques and tool support (components, plug-ins, libraries, metaprogramming, macros, templates, generic programming, run-time code generation, model-driven development, composition tools)

Properties of generative software

- Correctness of generators and generated code (analysis, testing, formal methods, domainspecific error messages, safety, security)
- Reuse and evolution
- · Modularity, separation of concerns, understandability, and maintainability
- Performance engineering, nonfunctional properties (program optimization and parallelization, GPGPUs, multicore, footprint, metrics)
- Application areas and engineering practice (distributed systems, middleware, embedded systems, patterns, development methods)

Empirical evaluations

 Empirical evaluations of all topics above (user studies, substantial case studies, controlled experiments, surveys, rigorous measurements)

We particularly welcome papers that address some of the **key challenges** in the field, such as, synthesizing code from declarative specifications • supporting extensible languages and language embedding • ensuring correctness and other nonfunctional properties of generated code • proving generators correct • improving error reporting with domain-specific error messages • reasoning about generators • handling variability-induced complexity in product lines • providing efficient interpreters and execution languages • human factors in developing and maintaining generators

Sponsored by ACM SIGPLAN

This year, GPCE seriously encourages submissions about empirical evaluations of generative software with special considerations during reviewing.
